For 90% of people on the internet, there is no need to upgrade Photoshop anymore. You're already using a better program than the newest version of Photoshop. Why pay \$1,500-6,000? The cost to upgrade means nothing if you don't have Photoshop in the first place. Why Photoshop? One of the most common ways to use Photoshop is to use Photoshop to edit images. If you're someone who just wants to display and publish a few images, there's no need to use the professional version of Photoshop. For example, you can use Lightroom or Photoshop Elements to edit images and save them to your computer. Many people use Photoshop for this kind of image manipulation. The following graphic editors are much easier than Photoshop. Lightroom, a popular photo editor, focuses on digital photography. It is a premium program that is available for both Mac and Windows. Lightroom is also available for mobile devices. There is a free version of the app and a pro version, with the pro version unlocking more features. Photoshop has the flexibility that makes it useful for a wide variety of different tasks. For example, a web designer can use Photoshop to make a logo or create a layout for a website. An animator can use the software to create a promotional video. It's also a popular tool for photographers. However, Photoshop is more than a basic image editor. It has a lot of powerful editing features that are useful for creating graphics for websites, making animated GIFs, and creating new images with more advanced editing features like layers. $m^* = 0.01$) and non-vitrified embryos compared to that of serum and the presence of zona pellucida \[\[@B40-ijms-20-01617]\]. After 10 min of thawing, the T^*_{c} of warmed vitrified oocytes is significantly lower than that of fresh oocytes \[\[@B41-ijms-20-01617]\]. In addition, it is easy to underestimate the total loss of vitrified oocytes and embryos due to inaccurate T^*_{m} measurements. There is a dose--response relationship between T^*_{m} measurement error and the level of cryoinjury. In other words, measurement error may have a greater impact on low-vitrified-concentration vitrified-thawed embryo \[\[@B42-ijms-20-01617]\]. T^*_{m} determination in clinical practice is mainly based on the calculation of real-time software or manual calculation, which may be prone to errors in operation and require the use of complex equipment. Over long periods, the relevance of changing equipment to ensure optimal results remains to be determined. The use of validated algorithms, such as MATLAB, excel, and Visual Basic, may overcome some of the current challenges regarding T^*_{m} determination. 4. Conclusions \{\#sec4-ijms-20-01617\} ===== The results of this study revealed that the use of a validated algorithm was effective and reliable for the determination of T^*_{m} in relation to the developing stage of human zygotes. In the early stages of pregnancy, in which the zygote has a high rate of growth, the T^*_{m} value is in the range of 40--50 °C. T^*_{m} is not a direct index of embryo development, but in combination with other indicators, it can be used as a simple method for evaluating embryo quality and viability. The aim of this study was to evaluate the impact of a quality-control program for identification of methicillin-resistant Staphylococcus aureus (MRSA) on quality of service and evaluation of the obtained results. A quality-control program for identification of MRSA was established and implemented in 6 microbiological laboratories. Quality control of identification of MRSA was carried out at least once a week. The following indices were used for evaluation: correctness rate (CR) of identification, CR of confirmation and the ability to exclude methicillin-resistant coagulase-negative staphylococci (MRCNS) from detection of MRSA. The program was implemented for 30 days. A total of 14 458 pathogens were identified in the analyzed period. Two centers were significantly better than other centers in identification of MRSA; their CR was over 95%. The most important results of the quality-control program were the following: a significant reduction in CR of identification and confirmation of MRSA, a substantial increase in the percentage of exclusion of MRCNS and the coefficient of concordance (CC) of the identification of MRSA. Implementation of a quality-control program for identification of MRSA in clinical laboratories improved the ability of laboratories in identifying MRSA.Role of surgery in the treatment of pulmonary metastases. Patients with pulmonary metastases from solid tumors usually have a dismal outcome. The limited effect of chemotherapeutic agents, associated with significant morbidity and mortality, has provoked a search for other treatment modalities. During the past two decades, resection of pulmonary metastases has become a well-established treatment for certain tumor types. This success was based on the experience of a small but significant group of carefully selected patients. More recently, much has been
