KEYMACRO is a portable program that can be used to replace the keyboard shortcuts used for the actions of other programs. With it, you can assign custom key combinations for almost any action of any program. It also includes a set of pre-defined shortcuts to allow you to immediately perform the desired action. Other included features KEYMACRO can configure multiple actions with different key combinations. The user can also specify the key that will open the Start menu. With the included configuration files, it is possible to customize the program to a huge extent. Cannot be bound to the desktop All you need to do is load the programs you want to assign keyboard shortcuts for, select the actions you want them to be assigned to and start the configuration process. There are no options to manually assign the shortcuts. The configurations are loaded from the configuration files included with the software, from a ZIP archive and from the registry. Visual interface for quick usage The application has a clean, easy-to-use interface with a few icons representing the actions to assign to key combinations. In addition, there is an explanatory toolbar with instructions on how to use the configuration files. After you have selected the actions to be assigned, you can go ahead and configure the shortcuts. Clicking on the arrows keys or backspace button will show a popup menu that contains all available shortcuts that can be assigned to the currently selected actions. You can also use the menu to edit the shortcut itself, to add it to the list of shortcuts, or even to remove it. Saved in the background for instant access With KEYMACRO, it is possible to assign shortcuts to multiple programs. When you run the software, it checks if the actions to be assigned are already configured. If they are, they are retrieved from the program itself. If they are not configured, they are saved in the configuration files. The process is instant and the shortcuts are saved in the background for immediate access. Support for 64-bit version of Windows Unlike the 32-bit version of the software, the 64-bit version can be used on both 32- and 64-bit systems. Now you can assign a combination of keys to perform actions on 64-bit versions of programs. Supports keyboard layouts The software supports all major keyboard layouts. The supported key combinations can be the ones produced by the software, the default shortcuts of the program, or you can even specify your own, custom ones. Good for all 77a5ca646e
